

(PDF) method.pdf: Description of the approaches to construct the topology.

Makes use of the data collected within the mongoDB database to generate a graph using the networkX library. Code will access a collection within the database called IP_Nodes. It then creates an empty undirected graph using the “networkx.graph” function and iterates through the documents in the IP_Nodes collection to construct the graph by adding an edge for each link that is a hop to a new IP address. Finally it draws a graph using the matplotlib library.
